**Abstract**

The Newcastleton and District Community Trust acquired land totalling 750 acres on Holm Hill, Newcastleton, from the Buccleuch Estate Ltd. in 2020. Calluna Archaeology has been commissioned by the Trust to carry out an archaeological survey of Holm Hill prior to the development of paths, bike trails and a new pavilion. This survey consisted of a desk-based assessment and a walkover survey.

A total of 105 features (or potential features) of archaeological interest were noted within the vicinity of the Holm Hill, of which 81 lay within its bounds. There is a small number of prehistoric sites among the predominantly medieval, post-medieval and modern sites in the vicinity.

## 1. Introduction

Calluna Archaeology was commissioned by the Newcastleton and District Community Trust (NDCT) to undertake an archaeological survey of Holm Hill, Newcastleton, Scottish Borders. This report consists of a desk-based assessment and a walkover survey of the area. In total Holm Hill consists of 750 acres of hillside to the west of Newcastleton village which was established in the late 18<sup>th</sup> century and is now a Conservation Area.

An archaeological survey of part of Holm Hill at Coulter Sike, Newcastleton has been carried out by the author on behalf of JDM Woodland Management and that report included a desk-based assessment and walkover survey (James 2023). The area in the vicinity of Short Sike may also be part of a separate survey in the future and so detailed discussion of this area is also excluded from this report.

A total of 105 features (or potential features) of archaeological interest were noted in the vicinity of Holm Hill, of which 81 lay within the bounds of the Trust's Holm Hill Property (see Illus. 1 & Table 1).

## 2. Location, Geology and Topography

Holm Hill extends for 750 acres to the west of Newcastleton in the parish of Castleton, Scottish Borders, NGR NY 4722 8737. The Hill lies on the west side of the Liddel Water, on gently sloping ground facing east and south-east, with the Black Burn to the north and Kirk Hill in the south. Four main streams run across Holm Hill into the Liddel Water, Ettleton Sike, Short Sike, Charlie's Sike and Coulter Sike. The altitude of the hillside ranges from about 100m to nearly 300m AOD.

The geology of the valley side consists of the Border Group of Carboniferous Sandstone, siltstone and mudstone and the higher ground to the west is basaltic lava of the Birrenswark Volcanic Formation (British Geology Viewer (BETA) <https://www.bgs.ac.uk/map-viewers/bgs-geology-viewer/>). The superficial deposits (where recorded) are of Devensian Till with patches of peat, especially on the higher ground.

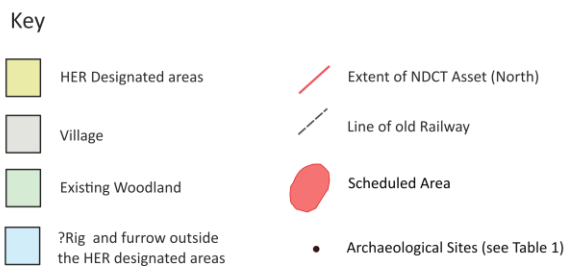

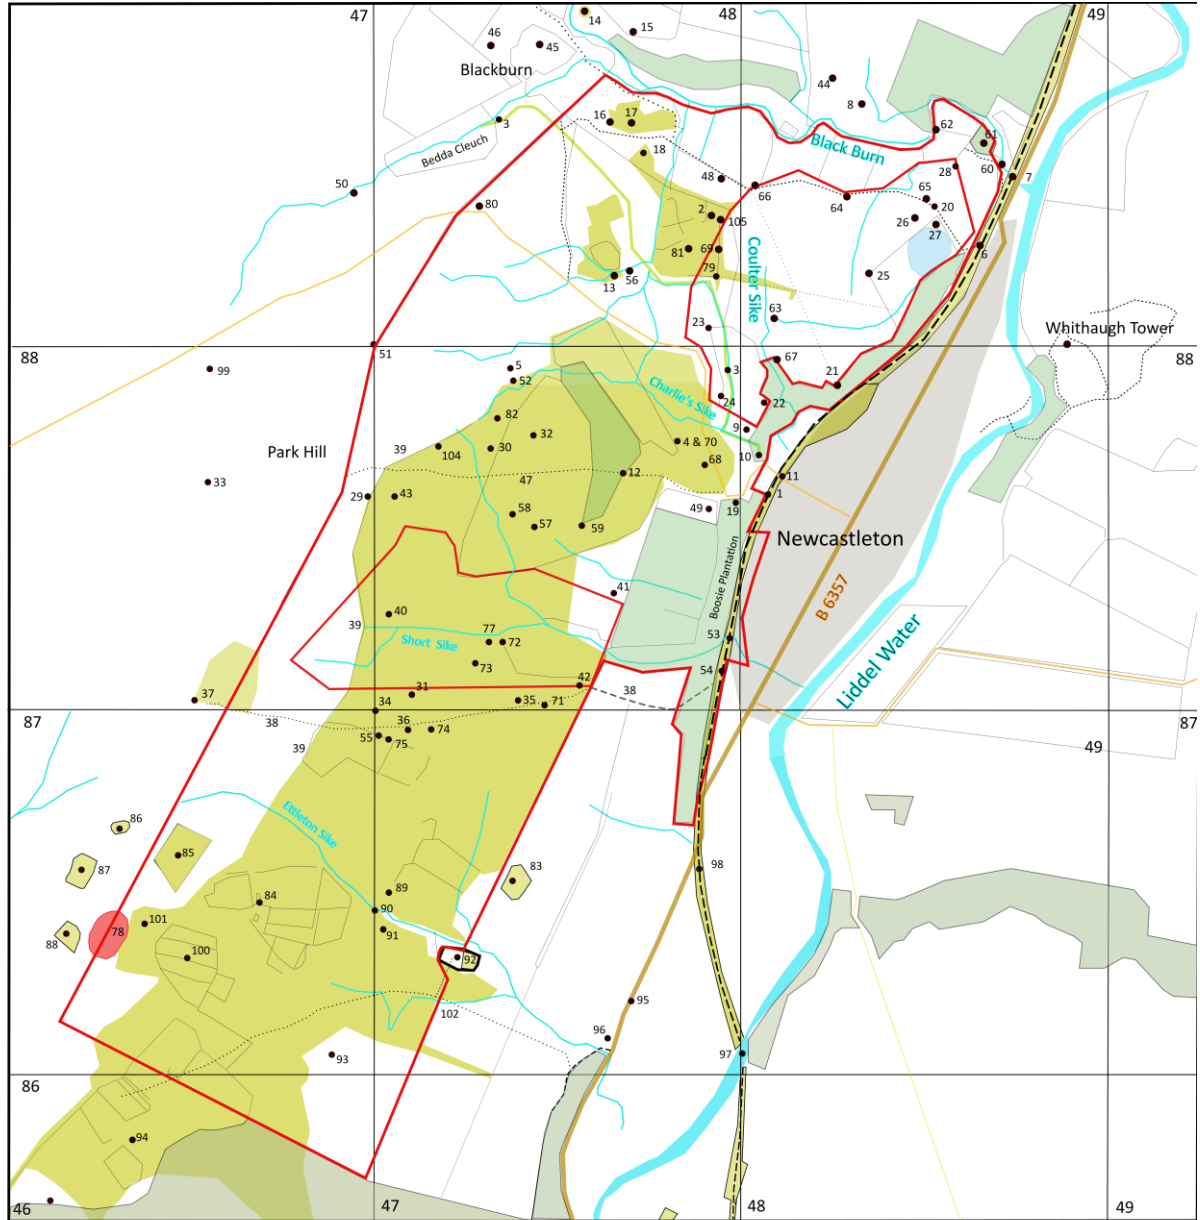

## 3. Methodology

The resources consulted as part of the desk-based assessment consisted of on-line resources, including the National Record of the Historic Environment maintained by Historic Environment Scotland (available through Canmore and Pastmap). Remote sensing data (LiDAR = laser imaging, detection, and ranging) were available via the National Library of Scotland. Historic maps were consulted on the National Library of Scotland website. Aerial photographs, provided on-line by the National Library of Scotland and by Googlemap, were also consulted. A walkover survey was carried out between November 10<sup>th</sup> and the 14<sup>th</sup> 2023 utilising a hand-held GPS, digital camera and pro-forma sheets. The walkover survey was guided by the existing known sites, evidence from the historic maps and the LiDAR data (see Table 1 and Illus. 1). Visibility of ground features was generally hampered by natural regeneration, tall grass, reeds and bracken, except where recent grazing had taken place. The weather was generally cold and dry.

## 4. Archaeological Background

Holm Hill lies to the west of Liddel Water, which has provided a route through the Scottish borders from the Solway Firth to the Lowlands for thousands of years. As a result, the archaeological sites in the vicinity reflect occupation and utilisation of the valley throughout prehistoric, medieval and modern times. There are, however, few known prehistoric sites within the Holm Hill property boundary (see Illus. 1). They include a possible prehistoric enclosure on the north side of the Black Burn (Site 14), which has been much-damaged by flooding and stone robbing. A fort on Kirk Hill (Site 78) lies partly within the southern part of Holm Hill and may be prehistoric or later in date. Other prehistoric sites in the vicinity include Ettleton enclosure (Site 83), a find spot of a jet ring (Site 51) and a cairn (Site 44.2). Further afield, hillforts, cairnfields, chambered cairns and burnt mounds are recorded.

Remains from later centuries are more frequent and have likely destroyed much evidence of settlement and cultivation from earlier periods. There were medieval castles in the vicinity (now ruined), Copshaw Tower (Site 19), Whithaugh Tower (to the east of the Liddel Water), Side (Site 94 to the south) and Mangerton (to the south-east). There are also numerous remnants of medieval and post-medieval farmsteads and cultivation (see Table 1), including boundary banks, huts, a sheepfold and several enclosures.

Illus. 1: Holm Hill and location of sites

The Holm was once part of the parish of 'Ettiltoun' and the parish church was located south of Newcastleton (see Site 92). The church no longer exists, but the burial ground contains medieval tombstones and was still used in recent times. The parish of 'Ettiltoun' was joined with Castletown after the Reformation (Origines Paroichiales 1851, 353 & 363).

The village of Newcastleton was established in 1793 when the township at Old Castleton was cleared (Canmore 67939). Nineteenth century sites in the vicinity include the Border Union Railway (Site 1) and associated bridges (Sites 6, & 7), under bridges (Sites 53 & 54), a signal box (Site 11), a mill lade (Site 3), field systems, (Sites 16, 17, 18), enclosures (Sites 23 & 25), a saw mill (Site 10) and a 19<sup>th</sup> century golf course (Site 5). The railway (Site 1) and some of its associated structures were removed during the Beeching Cuts of the 1960s, although the route of the railway has been retained as a footpath. Several tracks are depicted on early maps (Sites 20, 21, 38 & 102) as well as roofed buildings that are no longer seen (Sites 22, 24 & 48).

Previous archaeological surveys of the area include the RCAHMS Afforestation Land Survey (AFS Liddesdale), (RCAHMS 1996). This survey covered the area from Hermitage Castle in the north to the English border in the south. It revealed an extensive 'assarting' landscape within a medieval hunting forest. 'Assarting' consisted of clearing woodland for agricultural purposes, and tended to take place under population pressure during warm climatic periods. The RCAHMS team identified extensive areas of pre-Improvement settlement and cultivation in the form of rig and furrow and in some cases particularly narrow, possibly prehistoric 'cord rig'.

A review of historic maps highlighted the presence of old settlements. Blaeu's Atlas (1654) based on Timothy Pont's survey of 1560-1614, depicts 'Ettiltoun K', 'Syid', 'Ettiltounspa' 'Copshaw pk', 'Copshaw', 'Copshaha', 'Blackdubs', and 'Blaikburnfyd' on the west side of the Liddel Water, and 'Maingertoun', 'Mill of Maingertoun', 'Whithauch' and 'Greens' on the east side (see Illus. 2). The sites of 'Copshaw' and 'Whithauch' are depicted within a fenced enclosure that is shaded green, perhaps an area of maintained parkland (hence the 'haha'). A few trees are shown within the enclosure but not outside it. William Roy's map of 1747-55 depicts a small settlement on the west bank of the Liddel Water called 'Black Burn Foot' in the vicinity of where 'Blackdubs' was depicted by Blaeu. There are two small enclosures and a single structure called 'Park' to the south. Both are surrounded by strip fields and are bounded on the west by a strip of woodland. There is a road up the west side of the Liddel Water, but no bridge to the east bank at this point. The hills to the west of Park are bare of features. To the south 'Millholm' is shown surrounded by strip fields, but another settlement called 'The Side' is not. On the east side of the Liddel Water 'Greens' and 'Whitehaugh Castle' are surrounded by strip fields.

Illus. 2: Vicinity of Kirk Hill & Copshaw (Blaeu 1654)

Illus. 3: Blackburnfoot, Blackburn, Pathhead, Park, Ettletown, Millholm & Side (Stobie 1770)

Matthew Stobie's map of Roxburghshire (1770) also shows a road passing along the west side of the Liddel Water with settlements of 'Side', 'Millholm', 'Ettletown', 'Park', 'Pathhead' 'Blackburn' and 'Blackburn' (see Illus. 3). 'Blackburnfoot' is now shown on the north side of the Black Burn. There is presumably a bridge where the road crosses the Black Burn, although this is not named.

In 1780 a map by Thomas Kitchin still depicts a roughly oval-shaped green-shaded enclosure around 'Copshon' and 'Whitehaugh' and the Old Statistical Account (1795, 67) from approximately the same period relates that

'The whole of the holm land along the banks of the river appears formerly to have been covered with wood, and the sides of the hills to have been almost entirely in cultivation; the furrows and ridges are plain and evident....About the middle of the hills, on each side of the river Liddal, a deep ditch or a strong wall, appears to have been drawn almost the whole length of the country, beneath which lay the arable ground, where the [\*\*\*?] rows and ridges appear, and all above was either for pasture or common.'

By 1860 the planned village of Newcastleton has become established and the surrounding areas of woodland and an Improved field system are shown in detail (OS 1<sup>st</sup> edition 25 inch map). Other 19<sup>th</sup> century developments include a saw mill, dam and 'Minister's Well' (Site 10), a mill lade (Site 3) and a sheepfold (Site 9). A track (Site 20) and a footpath (Site 21) across the planting area are shown heading over the hill from Newcastleton towards the settlement of Blackburn. There are 'Old Quarries' to the south of Charlie's Sike and enclosures on the south bank of the Black Burn. A settlement of Blackburn is shown some distance north of a tributary, the Bedda Cleuch, and appears to be an Improved farm on a new site. The Knowehead farmstead (Site 37) lies to the west of a major enclosure wall across Park Hill with a track heading from Newcastleton (Site 38). A complex field system (Sites 84 & 100) is depicted lying to the east of Kirk Hill Fort. The 'Townfoot T.P.' (turnpike) and the bridge across the Liddel Water are also shown.

By the late 19<sup>th</sup> century, the OS 2<sup>nd</sup> edition 25 inch map depicts the route of the North British Railway (Site 1) along the Liddel Water, running parallel to the road through Boosie Plantation. This required the construction of a station, a viaduct, the Pathhead Bridge (Site 6) the Blackburn Bridge (Site 7), the Boosie Plantation road overbridge (Site 98) and the Liddel railway viaduct (Site 97). The road was diverted to the east of the railway and presumably the old road bridge (Site 60) was demolished. A large enclosure (Site 23) has also been constructed straddling the mill lade. A roofed building has been built on the edge of the woodland in the south (Site 22). The newly established golf course (Site 5) is not yet depicted although there is a new track heading to it from Newcastleton. Only a few changes are noted in the 1920 OS edition, including the construction of three rectilinear enclosures abutting the woodland in the east (Site 25) and a roofed building (Site 24) on the boundary of an enclosure (Site 23). A Hospital for Infectious Diseases (Site 49) has been built to the west of the Park Tower site.

The LiDAR images of this area are extremely revealing in that they highlight numerous drains, earth banks, areas of cultivation as well as modern disturbance. What are thought to be potentially significant features were noted as they required ground truthing. For example, a group of circular and oval shaped features on the LiDAR images (Site 28) have the potential to be a historic settlement, perhaps 'Blackdubs' or 'Pathhead'. The Coulter Sike walkover survey, however, suggested that instead they were possibly animal feeding stances (James 2023).

In addition to the individual 'Sites' discussed above and listed in Table 1, there are 'Areas' which are considered to be significant archaeological landscapes in the Historic Environment Record (see Illus. 1). These Areas enclose the evidence from the archaeological record, primarily derived from aerial photography and fieldwork by the RCAHMS. They consist of networks of field systems and occasional settlements which have resulted in a multi-period landscape the details of which have not yet been mapped.

## 5. Results (see Tables 1 & 2)

### 5.1 Blackburn to Coulter Sike (Sites 2, 13, 16, 17, 18, 51, 56, 60, 61, 62, 69, 79, 80, 81 & 105).

The Historic Environment Record includes three designated areas in the vicinity (see lime green shaded areas on Illus. 1).

5.1.1 Site 2 encompasses an extensive area consisting of the Blackburn Farmstead, kiln and field system (see Illus. 4). This area is bounded on the south by the mill lade (Site 3) and to the west by an unnamed burn. A triangular-shaped enclosure seen on LiDAR in the north measured about 25m across within which were lazy beds up to 0.3m high, spaced 2m apart and aligned NE-SW (see Illus. 5). To the west there are enclosed fields. To the east there is a possible oval-shaped structure (Site 105) which may be one of several buildings in the vicinity as suggested by the LiDAR data. A [?corn drying] kiln (Site 81) was identified by the RCAHMS survey (1996), but could not confidently be located during this survey as the tall grass and reeds and generally humpy vegetation have obscured less prominent features. Several earth banks (including Sites 69 and 79) were seen.

#### 5.1.2

Sites 16, 17 and 18 were designated field systems as they are shown on the 1<sup>st</sup> edition OS map as pecked enclosures. This area is characterised by short green grass that has clearly been improved. A possible oval-shaped turf structure (Illus. 6) and a circular scooped area 10m in diameter were identified (Site 16). The scooped area is possibly a prehistoric hut circle. Several sloping terraces (Site 17) were interpreted as agricultural lynchets which may be prehistoric or medieval in date (Illus. 7). Site 18 is also an area of improved grass which contains very slight remains of rig and furrow.

#### 5.1.3

Site 13 was recorded as two turf structures and four fields. One long turf structure was found measuring 15m by 5m externally with banks spread 2m wide (Site 56). Four fields can be seen clearly on LiDAR extending north from this point. It is possible that other structures survive but are less visible amongst the tall grass and reeds. Two banks were recorded aligned N-S extending northwards towards the burn (see Table 2).

#### 5.1.4

A viewpoint known as Lord Walters Seat (Site 80) is located via a path from the road at NY 47299 88363. A roughly circular, stone-built feature that is reached off the same path is located at NY 47291 88413. The circular feature is marked on the modern OS map and can be seen on an aerial photograph. The LiDAR data shows a very slight bump at the location of the circular feature. Neither of these features are marked on historic OS maps, are currently not recorded on Canmore and do not lie within a significant area on the HER database. The desk-top assessment has indicated that there are no known significant features in the vicinity of the seat that would be affected by works to the car park area or seat. It was not visited during this survey.

#### 5.1.5

A few features have been noted outside the designated HER areas. Site 60 (the site of the pre-railway road bridge) was visited during the Coulter Sike survey and no trace of a bridge could be seen. Site 48 is marked as a roofed building on the 1st edition OS map. Site 61 (a quarry), Site 62 (a footbridge) and Site 48 were not visited during this survey. Site 51 is a findspot of a probably prehistoric jet ring accessioned by the British Museum in 1937. The location given is accurate to only 1km and is designated unprovenanced, which can only be interpreted as being found somewhere in the locality.

### **5.2 The Golf Course & vicinity (Sites 4, 5, 9, 10, 12, 19, 29, 30, 32, 39, 41, 43, 47, 49, 52, 57, 58, 59, 68, 70, 82, 104)**

The whole of the Golf Course and much of the land to the SW has been designated in the HER.

#### 5.2.1

A prehistoric settlement (Site 32) is located within rough ground on the Golf Course. It was described as four stone built round houses, diameter about 9m, within a banked enclosure that measured 61m by 49m. The site is on gently sloping ground that is covered with dense bracken growth and surrounded by small trees on all sides except down slope (Illus. 8). There are numerous stones underfoot which could well be the remains of stone building foundations, although the shape of round houses could not be discerned beneath the bracken.

*Illus. 8: Site 32. Prehistoric site beneath dense bracken*

*Illus. 9: Earth bank (Site 58)*

### 5.2.2

The medieval site of Park Tower was said in the 19<sup>th</sup> century to be located at the bend of the Langholm Road (Site 19). An area measuring about 10m wide and 20m long forms a D-shaped terrace beside the road, beyond which the ground slopes steeply down. The vegetation is dense brambles and young oak trees. There is little evidence of stones apart from a slight stone pile measuring 4m by 2m at NY 47976 87570. There is therefore little to suggest that this is the site of a tower although excavation could confirm this. It is likely that the tower was somewhere in the vicinity as suggested by historic maps. Having become a ruin by 1793, it may have been robbed of stone for the surrounding field walls in the early 19<sup>th</sup> century and the site lost beneath a widened road. A stone with an arrow slit and another dated 1686 were seen built into cottages in the village in the 19<sup>th</sup> century, but have not been seen recently.

### 5.2.3

Much of this area has been designated an Archaeological Landscape and this is backed up by the visible features on LiDAR and the remains seen across the landscape. There are several earth banks (some with ditches) which may date from the medieval to the Post-medieval period. These include what is likely to be a medieval head dyke and ditch (Site 39) that meanders slightly from Charlie's Sike in the north to beyond Ettleton Sike in the south (RCAHMS 1996). Similar significant earth banks can be seen within the golf course (Sites 58 (Illus. 9) & 59). The slight remains of several turf structures have been seen (Sites 29, 30 & 52). A particularly substantial structure was noted at the edge of the golf course fairway (Site 57, Illus. 10). This sub-rectangular structure had two chambers the largest of which was about 15m long and 8m wide externally with earth and stone banks up to 0.5m high. It may be significant that immediately to the south, rig and furrow survives within the fairway (Illus. 11). The RCAHMS identified five buildings and banks south of Charlie's Sike (Site 4) which they described as being reduced to slight terraces on a fairway. However, not even slight structures could be confidently identified at this location. An oval-shaped hollow was seen to the east (Site 70) within dense bracken which measured about 6m by 3m. There were two other sites which could not be located (Site 12 and 82). Site 12 was described as two turf and stone building foundations on the fairway, but nothing coherent could be seen at this grid reference. It is possible that the structures lay further west within the rough. Site 82 was identified by the RCAHMS as a farmstead but nothing could be seen at this location.

### 5.2.4

Nineteenth century sites include a sawmill, lade and dam (Sites 3 & 10), a sheepfold (Site 9) and a 19 hole Golf course (Site 5). Twentieth century sites include a Hospital (Site 49) and a Monument to John Byres (Site 68). A track was depicted on the 1<sup>st</sup> edition OS map of the mid 19<sup>th</sup> century crossing the area from Newcastleton towards Park Hill (Site 47) some of which is used to access the golf course. A feature seen on LiDAR as a possible enclosure (Site 41) was identified as a patch of bracken and is therefore not archaeologically significant.

*Illus. 10: Site 57 Substantial banks in the rough*

*Illus. 11: Rig and furrow beside Site 57*

### 5.3 South of Short Sike (Sites 31, 34, 35, 36, 37, 38, 39, 55, 71, 74, 75)

Most of this area has been designated as significant in the HER.

The RCAHMS (1996) identified several settlement sites within the area to the south of Short Sike which were thought to be multi-period (Sites 31, 35, 36 & 55). Sites 31 and 35 each included four groups of buildings, but no structures were seen in the field probably because of the long grass and hummocky surface. Site 36 consisted of five buildings and Site 55 was a single building, but these could not be seen. These structures lay within boundary banks and areas of cultivation. The possibly medieval bank (Site 39) continued on the west side (see Illus. 12 & 13). Other earth banks included Site 71 which was spread 2m wide and was up to 0.4m high. Site 75 was 2m wide and 0.5m high and Site 34 was 0.5m wide and 0.3m high. There was no clear sign of rig and furrow at Site 34 probably as the grass was long and hummocky making the identification of slight features very difficult. The 19<sup>th</sup> century farmstead of Knowehead (Site 37) can be clearly seen on LiDAR spanning the boundary wall of Holm Hill in the west. The buildings associated with this site are outside the Holm Hill property. A track (Site 38) is shown on the 1<sup>st</sup> edition OS map extending from Newcastleton to Knowehead. There are many modern drainage features crossing the hillside and these are clearly shown on LiDAR. One example is a modern drain (Site 74).

*Illus. 12: Site 39 Head dyke and ditch looking N*

*Illus. 13: Site 39 Head dyke and ditch looking S*

### 5.4 Kirk Hill & environs (Sites 78, 84, 85, 89, 90, 91, 93, 100, 101, 102 & 103)

Most of this area has been designated as significant in the HER.

#### 5.4.1 Kirk Hill (Scheduled Ancient Monument; Site 78)

The site of Kirk Hill was described in the mid 19<sup>th</sup> century as a 'dyke or rampart of earth and stone, and nearly

circular – now covered with green turf’ and surrounded by a ‘deep ditch’ (Maughan 1868). A ‘modern wall’ ran through the centre of the site from east to west and it had an ‘oval appearance’ with an entrance on the south side and a smaller ditch within it. He records that a ‘great quantity of stones’ were carted away to build the adjacent fences. The writer then suggests the site had a Druidic connection and may have been the site of a stone circle. The only evidence he presents for this suggestion was a similarity with another site at Mayborough near Penrith. He also notes an ancient tradition of a cromlech in the vicinity. (A cromlech is a large upright stone laid on upright stones, otherwise known as a dolmen) He then relates a local tradition that the enclosure was ‘a place of sepulture’ (sic) which once enclosed a ‘temple’.

The site was visited by professional archaeologists from the Royal Commission in 1933 and was described as an oval palisaded fort (see Canmore 67858). They drew the rampart and added amendments in 1948 after which the description was slightly expanded to a ‘sub-oval enclosure surrounded by a massive rampart’ with an outer ditch and an inner scoop. The entrance was noted in the centre of the SE side and may have been widened by ploughing. They suggested that the bank could have had drystone revetting given the amount of stone that was said to have been removed from the site. No evidence for structures was seen within it and it was suggested that it was ‘later than the prehistoric period’, although no specific reason was given for this statement.

In 1996 it was noted that an OS triangulation station was located on the highest part of the rampart (outside the Trust’s Holm Hill property). The northern half of the interior was flat but the southern half showed evidence of cultivation and two trenches could be seen around the northern interior. The Afforestation Land Survey, Liddesdale was undertaken by the Royal Commission in 1996 (see Illus. 14). They noted that the entrance was overlain by the edge of a Post-medieval field system and that the bank had been slighted in the vicinity. There were two internal ditches around the perimeter that had not been noted before.

From an aerial photograph it is clear from their dark green colour that the enclosures to the east of Kirk Hill have been improved (see Illus. 15). The field systems in the vicinity of Kirk Hill are multi-period, probably dating from at least the medieval period. The southern part of Kirk Hill is also dark green suggesting that either there was a greater degree of human activity here or that it is wetter causing greater vegetation growth.

The interior ditches are more visible on the LiDAR data and there is possibly a structure in the south east corner of the enclosure, although this could also be vegetation. There are other extremely slight features in the interior which it would be rash to interpret as archaeological without further investigation. (From past experience the LiDAR data can show features which are hardly visible on the ground and would require geophysics or excavation to confirm).

*Illus. 14: Excerpt from the RCAHMS Afforestation land survey 1996 (green shading is improved ground)*

*Illus. 15: Aerial photo of Kirk Hill (Google)*

The site visit could not detect the presence of any internal features despite the grass being relatively short. The fort was much as described apart from the relationship of the outer ditch and the bank of Site 101. It appeared to this author that the fort ditch had possibly cut through the enclosure bank and therefore post-dated it. One could therefore cautiously speculate about a prehistoric or early-medieval date for the enclosure (Site 101) and a later date for the fort. It is of interest that all the significant sites in this area are concentrated a short distance from Kirk Hill (Sites 83, 84, 92, 94, 96, 100 & 101).

#### 5.4.2 Significant sites outside Holm Hill (Sites 83 & 92)

Ettleton Enclosure (Site 83) lies just to the east of the Holm Hill property boundary. It was identified by the RCAHMS as a late prehistoric enclosure which still survives as a recognisable feature although damaged in the past by ploughing and crossed by two croft boundaries. An examination of the aerial photographs and LiDAR suggests the presence of at least two circular features, possibly hit circles, within the enclosure. The significance of this is that it is further evidence of remnants of prehistoric settlement and activity in the area which has been largely erased by later cultivation.

The site of Ettleton medieval parish church (Site 92) also lies just east of the Holm and the medieval tombstones displayed within railings are Scheduled. The church ceased to be the parish church at the Reformation. In the mid-17<sup>th</sup> century the place name 'Ettiltounspa' is shown south of 'Copshaw PK' and north of 'Syid' with 'Ettiltoun K' further south again (Blauw 1654). Given that 'Ettiltoun K' represents the church and is unlikely to have moved in the landscape, the other place names and their location warrant further research.

#### 5.4.3 Multi-period settlements 84, 85, 89, 91 & 105

The remains of several phases of settlement and cultivation were identified over an extensive area to the east of Kirk Hill fort (See Illus. 14, RCAHMS 1996). One of the main concentrations of buildings was surveyed in detail (Site 84, see Illus. 18 & 19). The remains of the settlement and field system (Site 84) lie within grass and reeds and are generally well preserved. A turf structure at NY 46690 86487 is aligned N-S and measures about 13m by 4m with banks up to 0.5m high (Illus. 20). There are more reeds growing here especially in the middle of the structure. A sub-rectangular enclosure (as seen below) at NY 46678 86432 has banks spread 2.5m wide and are up to 0.6m high. There are earth banks, turf structures and hand-dug lazy beds (see Illus. 21). Although the vegetation is grass and reeds the remains are clear to see.

It was suggested that this was the location of a pre-Improvement settlement called Side (RCAHMS). This is not

certain however, as another, similarly complex, site (possibly including Side 'Tower') is located to the south, outside the Holm (Site 94). A 14<sup>th</sup> century documentary reference to Side mentions 'Locus Willelmi del Syde' (RHM I, App 17) and historic maps depict the place name 'Syid' (Blaeu 1654) and 'Side' (Roy 1745-55) which indicate that this was a significant Post-medieval, Pre-Improvement settlement.

*Illus. 18: Site 84 Ettleton Sike survey (RCAHMS)*

*Illus. 19: Site 84 Ettleton Sike (LiDAR)*

*Illus. 20: Site 84 Structure @ NY 46690 86487*

*Illus. 21: Site 84 Lazy beds @ NY 46672 86488*

Two other sites consisting of turf buildings and field systems span Ettleton Sike. Two lengths of bank aligned north-south were located (Site 103) although the turf hut (Site 91) was not detected among the grass and bracken. Site 89 was not visited. Site 90 refers to an oblique aerial photograph of the area held by the RCAHMS. Sites 100 and 101 relate to earth banks forming a series of fields seen in the vicinity of Kirk Hill. As suggested above, it is possible that Site 101 pre-dates the bank and ditch of Kirk Hill fort. The west bank of Site 100 overlay the medieval head dyke (Site 39), supporting the multi-period nature of activity here. A possible oval shaped structure was detected further east (Site 105) which measured 6m by 4m externally.

Site 85 was identified by the RCAHMS from aerial photographs as a Post-medieval stock enclosure. It does not appear on the OS maps, but can just be discerned on LiDAR. Its straight sides and square corners would support it being Post-medieval in date rather than earlier. Three other sites just outside the Holm Hill property (Sites 86, 87 & 88) consist of a turf building, rig and furrow and lazybeds, showing that there was Post-medieval activity on the west side of Kirk Hill as well as the east.

## 6. Discussion

Although the valley has most probably been utilised throughout prehistory for settlement and cultivation there is very little evidence for this in the current archaeological record on the Holm Hill property. The only known prehistoric site is a settlement consisting of four round houses that was identified by RAHAMS and is now lying within a patch of vegetation on the golf course (Site 32). A possible enclosure (Site 66) and a jet ring find spot (Site 51) may also be slight traces from this period. Several farmsteads, banks and areas of cultivation were identified, but these have been interpreted (because of their rectilinear shape) as either medieval or later (Pre-Improvement) in date. The RCAHMS survey and the historic maps provide the evidence for there being several Pre-Improvement farmsteads across the hillside, most of which do not appear on modern maps. These settlements were not fixed in the landscape as, over time, they could move within the farm boundary because of ownership changes, subdivision, or perhaps even pest control. Medieval settlements are particularly difficult to identify on the ground as the materials used were organic and apart from slight stone foundations were generally constructed of timber and turf, the remains of which would often be recycled on the fields as manure.

LiDAR images have been very useful in drawing attention to potential sites and recording the alignment and width of rig and furrow, as well as highlighting drainage features and slight humps and bumps, some of which are not discernible on the ground. The timing of the survey during November meant that the vegetation had potentially died down. However, the grass was still high and the ground surface uneven, which did not assist the identification of subtle features. The presence of the Golf Course with its mown fairways and unimproved rough has had contrasting effects on the archaeological remains. Some features that were visible on the fairways are no longer visible, while features within the rough remain. One recommendation however, would be for trees to be removed from the interior of the prehistoric site (Site 32) before they grow too big and the roots damage the site.

The Archaeological Landscapes (shaded green on Illus. 1) are the most sensitive areas on Holm Hill. However, their identification does not preclude development within them as long as mitigation measures are put forward that would prevent damage. For example, significant earth banks should not be broken through and a buffer zone should be left to protect them. With regard to rig and furrow cultivation, it is sometimes sufficient, for example, to record the width, height and alignment of the rigs.

## 7. Suggested mitigation measures

A potential trail network is being developed for Holm Hill consisting of three zones, the Coulter Syke Zone, the Golf Course zone and the Park Hill zone.

Suggested mitigation measures

1. Where possible this development will avoid damaging all significant archaeological sites.
2. A buffer zone of 10m is suggested around the possible prehistoric enclosure Site 66.
3. Buffer zones of 5m will be retained around the mill lade Site 3 and structures 13 & 56.
4. Buffer zone of 3m will be retained on either side of all earth banks, stone walls and remaining features, (excluding rig and furrow). Where this is not possible, crossing the line of a bank for instance, then a suitable crossing point will be chosen that will minimise damage eg, crossing at a point that is already damaged.
5. Areas of rig and furrow will be recorded (width, height & alignment) before being affected by the development.
